

A. What I Did:

The steps I took during this lab was:

- opening the Jupyter Lab

- creating a markdown cell with the text "My first markdown cell in Jupyter."

- Creating a code cell with the python code `print("Hello, World!")`

- And ran the code

My Github account and repository were made last semester, so I made use of it for this.

B. What I Learned:

The new concept used in the lab was

- `print("Hello, World!")`, which printed the words in the parentheses once the code was run.

So far using Github and Jupyter Notebooks has been both fun and easy, but I expect it to get harder later down the line.

There weren't any challenges for this lab.

C. Questions or Comments (Optional):

I don't have any questions or comments.
